

ALGOVIA AI

Website Content & Structure Guide

How to Use This Document

This guide follows the exact structure of the approved Algovia AI website map (Company, Service Offerings, Research & Learn, Success Stories, Our Team, Talk to Algovia AI). Each section below corresponds to a page or page-group on that map and contains the copy, structural notes, and content status needed to build it.

Content status legend

[READY]

Sourced directly from the approved Algovia AI deck. Copy can be used largely as-is.

[NEEDS INPUT]

Placeholder only. Requires specific information, assets, or a decision from Algovia before the page can go live.

Note to developer: Boxed notes like this one throughout the document flag structural or technical guidance for the build: component suggestions, forms, or open questions.

1. Company

1.1 About Us

1.1.1 Profile

[READY]

Algovia AI is a leading AI Transformation and Execution firm that helps organizations move from strategy to execution, adoption, and measurable value. We combine senior business transformation expertise with AI build capability to deliver solutions embedded into operating models, workflows, governance, and performance management.

We are not a traditional consultancy. We are not a software vendor. We are the partner that connects both, and stays accountable until AI becomes business as usual.

Algovia AI works primarily with Boards and Executive teams across governments and enterprises in the UAE, the Kingdom of Saudi Arabia, Europe, and Australia, backed by an international network of AI and industry experts, and delivered through an advisory, implementation, and value-realization engagement model.

At a glance

Founded by	Business transformation executives & AI builders
Markets	UAE · KSA · Europe · Australia
Primary clients	Boards & Executives across governments and enterprises
Engagement model	Advisory, implementation & value realization
Partnership network	International network of AI & industry experts

Note to developer: This 'at a glance' table works well as a stat strip or side panel on the About page. Pull the boldest line ("We are not a traditional consultancy...") as a large pull-quote near the top of the page.

1.1.2 Vision & Mission

[READY]

Vision

To lead globally in intelligent AI execution, enabling people and industries to operate with greater impact, agility, and autonomy.

Mission

We create competitive advantage through AI-driven execution that combines deep research, industry expertise, and the activation of organizational knowledge to deliver innovation, agility, and measurable impact at scale.

1.1.3 Our Founders

[READY]

Houssam Abiad

Board Director & Co-Founder: Market Leader / Strategy Transformation Partner

Houssam is a seasoned executive and former Deputy Lord Mayor with 20+ years across public, private, and startup sectors. He has led major urban, infrastructure, and economic initiatives, driving transformation and innovation at scale. A trusted board member, he brings deep governance and cross-industry expertise. His leadership blends strategic vision with agile, results-driven execution.

Mohamad Kinawi

Board Director & Co-Founder: AI Innovation Leader / AI Architecture & Delivery Partner

Mohamad is an electronic engineer, AI strategist, and seasoned investment banker with global experience spanning London, Frankfurt, and Shanghai. An MBA graduate and multi-time founder, Mohamad brings a rare blend of financial acumen, systems thinking, and deep tech expertise, building intelligent platforms that connect modern life with global opportunity.

Lara El Khayat

Chief Executive Officer & Co-Founder: Business Transformation Leader / GRC & Business Transformation Partner

Lara brings 24 years of advisory experience across GRC and Business Transformation, having served as Partner at global consulting firms. She has worked closely with Boards & Executives in key regional institutions (ADNOC, Mubadala, Majid Al Futtaim, TAQA, Saudia, Abdul Latif Jameel and Savola Group), leading GRC programs, IPO readiness, and operating model transformations that de-risk key transitions, strengthen governance, and deliver business value at scale.

Carmen Hamze

Business Partner & Co-Founder: Digital Transformation Leader / Digital & Business Transformation Partner

Carmen brings 14+ years of experience advising public-sector and energy organizations across the GCC, including ADNOC, Aramco, MoEn, DEWA, MIM, SEC, and SERA. As a former Partner at Roland Berger and Monitor Deloitte, she advised senior executives on strategic and operational challenges, bridging policy, strategy, technology, and execution to deliver large-scale transformations, advance sector reform, unlock investment, and drive measurable outcomes.

Note to developer: Founder headshots exist in the deck at print/deck resolution. Confirm web-resolution before launch.

1.2 Press

1.2.1 Press Releases

[NEEDS INPUT, structure drafted]

No press releases exist yet. The page should launch with the structure below, ready to receive content as milestones occur:

- Newsroom-style feed: title, publish date, category tag, 1–2 line summary, "Read more" link.
- Suggested categories: Company Milestones & Funding · Strategic Partnerships · Major Client Engagements · Awards & Recognition · Executive Appointments.
- Filter/tag by category once there are enough entries (5+) to make filtering useful.

Note to developer: Until real releases exist, avoid populating this page with placeholder/dummy entries. An empty, well-designed "newsroom" template with a short "More to come" note reads better than fake content.

1.2.2 Engaging with our Community

[READY]

Algovia AI's impact isn't limited to client engagements. We invest in the wider AI ecosystem across the region by sharing what we learn, supporting the next generation of AI talent, and contributing to the conversations shaping how AI is adopted responsibly.

Note to developer: This section is aspirational scaffolding based on Algovia's stated positioning. Limit content to the above statement for now.

1.3 Careers & Network

1.3.1 Careers

[READY]

Suggested page copy:

Build what comes after the pilot.

We're a growing team of 700+ cross-disciplinary professionals across Artificial Intelligence, Software Engineering, Data Analytics, Business Intelligence, and Digital and Business Transformation.

If you want to be part of our team and journey, we want to hear from you!

Suggested application form fields

- Full name
- Email address
- Phone number
- LinkedIn profile URL
- Area of expertise / discipline
- CV / resume upload
- Cover note (optional, short text)

1.3.2 Network

[READY]

Beyond our core team, Algovia AI works with an international network of AI and industry experts who offer specific deep sector or technical expertise where needed.

Join Algovia's Network.

If you're a senior practitioner, former operator, or industry specialist who wants to work on select AI transformation engagements, apply to join Algovia's expert network.

Suggested application form fields

- Full name
- Email address
- Phone number
- LinkedIn profile URL
- Area of expertise (free text or tagged dropdown, aligned to our sector list; see Section 4)
- Years of experience
- CV / resume upload

Note to developer: Careers and Network should be two distinct forms. The former is full-time hiring, the latter is an affiliate/associate expert pool. Keep the visual distinction clear (e.g., two cards, two buttons) so applicants self-select correctly.

1.4 Contacts

[NEEDS INPUT]

Field	UAE: Dubai Office	KSA: Jeddah Office
Telephone	[to be supplied]	[to be supplied]
Address	[to be supplied]	[to be supplied]
Email	[to be supplied]	[to be supplied]
P.O. Box	[to be supplied]	[to be supplied]

Also include:

- General company email address (for the contact form's "send to" address)
- LinkedIn company page URL
- A general enquiry contact form (Name, Email, Company, Message) distinct from the "Schedule a Meeting" CTA under Service Offerings (Section 2.3.2), which is sales-intent rather than general enquiry.

2. Service Offerings

2.1 Our Value Proposition

[READY]

Most firms stop at strategy or software. Algovia combines business transformation expertise, deep operational understanding, and proven AI execution to embed intelligent AI into the decisions, workflows, and operating models that drive real performance.

Senior Business Transformation Expertise

Our team has led enterprise-scale transformation programs across governments and large corporations as accountable execution owners, not just advisers. This allows us to navigate the true complexity of change and drive the targeted results that matter most to you.

Deep Cross-Sector Operational Understanding

Having operated inside the functions & industry sectors we transform, we design solutions tailored to how your business actually works. No generic frameworks. Just targeted solutions that drive faster adoption and tangible business impact.

Proven AI Design & Execution Capability

With 700+ cross-disciplinary AI professionals, we bring deep technical expertise that is rarely available in a single partner. Our proven track record across numerous successful AI designs and deployments gives clients the confidence of working with expertise that has been tested & delivered at scale.

Digital Transformation & Change Management

Deploying AI without managing change guarantees failure. Our proven approach embeds governance, business ownership, and process redesign into engagements, ensuring solutions are embraced and sustained to extract lasting business value.

The AI Value Gap: the problem we solve

Failure Mode	The Problem	How Algovia Solves It
01: Ambition without Prioritization	Organizations know AI matters but struggle to identify use cases that are material, feasible, and worth scaling.	Algovia structures and prioritizes use-cases, tying them directly to business targets, so effort & investment goes where it counts.
02: Technology without Foundations	Tools are deployed into environments that are not ready to support them, including fragmented data & systems operating in silos.	Algovia diagnoses data & infrastructure readiness before any AI build begins, ensuring foundations are in place for a technology that performs and scales.
03: Pilots without Adoption	AI initiatives stop at proof of concept because they are not embedded into workflows, roles, or governance.	Algovia embeds change management, business ownership & process redesign into solutions to enable effective adoption supported by the right operating model.
04: Advice without Accountability	Advisory consulting stops at recommendations; technology vendors stop at deployment. No one is accountable for outcomes.	Algovia bridges the gap, embedding governance, risk, and controls from day one, while remaining accountable for delivery, adoption, and measurable outcomes.
05: Impact without Measurement	Benefits are promised but rarely tracked through clear KPIs, baselines, and value realization routines.	Algovia anchors engagements in client targets and KPIs to ensure that impact is realized and sustained.

Note to developer: This framework works well as a supporting "why this matters" module on the Value Proposition or Home page: five common failure modes, each paired with how Algovia addresses it.

2.2 Our Service Portfolio

[READY]

WHERE STRATEGY MEETS EXECUTION

Our Service Portfolio

AI & Digital Solutions

- > AI Strategy
- > Artificial Intelligence
- > Computer Vision
- > Software Development
- > Data Engineering & Analytics
- > IoT & Embedded Systems

Intelligent Business Solutions

- > Business Strategy & Operating Model
- > Governance, Risk & Compliance
- > Cost Optimization
- > Process & Customer Experience Transformation
- > Capital Markets Solutions
- > Internal Audit & ICFR

2.2.1 AI & Digital Solutions

The build capabilities behind Algovia's execution.

AI Strategy
WHY NOW National & Corporate AI mandates demand fast clarity on how AI can create value.
WHAT WE DELIVER ● AI Strategic Initiatives & Roadmap ● AI Solution Scoping
BUSINESS IMPACT Investment concentrated on use cases that move the P&L.

Artificial Intelligence
WHY NOW Boards are expecting AI adoption to move from chatbots to systems that act with proper governance.
WHAT WE DELIVER ● Agentic AI ● Generative AI

- Machine Learning
- AI Consulting
- Agentic AI Security & Governance

BUSINESS IMPACT

Faster decisions and business automation, governed the way boards expect.

Computer Vision

WHY NOW

Rising business needs for AI solutions that can see, inspect and act on the physical world.

WHAT WE DELIVER

- Object Detection
- Image & Video Analysis
- Quality Inspection
- Industrial Automation

BUSINESS IMPACT

Fewer defects, less downtime, and cost optimization to relieve margin pressures.

Software Development

WHY NOW

Business efficiency mandates demand faster, cheaper delivery without sacrificing quality.

WHAT WE DELIVER

- Enterprise Platforms
- Cloud-Native Applications
- Back & Front-End Development
- Mobile Applications

BUSINESS IMPACT

Modern platforms that operate faster and cost less to run.

Data Engineering & Analytics

WHY NOW

Leaders need real-time visibility into performance and risks, not static reports.

WHAT WE DELIVER

- Data Platforms
- Business Intelligence
- Predictive Analytics
- Data Science
- Automated Doc & CAD Analysis

BUSINESS IMPACT

One source of truth that enables quick & effective decisions in an evolving market.

IoT & Embedded Systems

WHY NOW

Scaling business operations require hardware & systems that are purpose-built & effectively adopted.

WHAT WE DELIVER

- Custom Hardware & Firmware
- Internet of Things
- On-board / Edge Processing
- Connectivity & Sensors

BUSINESS IMPACT

Infrastructure that scales with the business instead of constraining it.

2.2.2 Intelligent Business Solutions

The governance and transformation capabilities Algovia embeds alongside every AI build.

Strategy & Operating Model
WHY NOW As competitors restructure around AI, businesses need to rethink their strategy & operating model to compete.
WHAT WE DELIVER • Business & Digital Strategy • SMO & PMO • Operating Model Development & Transformation
BUSINESS IMPACT Strategy and operating model built to compete in a disrupted market.

Governance, Risk & Compliance
WHY NOW As evolving markets reshape how business gets done, governance, risk & compliance (GRC) must keep pace.
WHAT WE DELIVER • Corporate Governance • Risk Management • Compliance Management • Policies & Procedures
BUSINESS IMPACT GRC framework that is a competitive advantage, not a compliance checkbox.

Cost Optimization
WHY NOW Boards demand budget rationalization and margin protection that doesn't come at the expense of quality.
WHAT WE DELIVER • AI-Enabled Cost Optimization Assessment & Solutions
BUSINESS IMPACT Savings delivered without cutting into what clients experience.

Business Transformation

WHY NOW

Business efficiency mandates require transformation designed around evolving strategies.

WHAT WE DELIVER

- Business Process Transformation
- Customer Experience Transformation

BUSINESS IMPACT

Leaner processes and better customer experience that act as market differentiators.

Capital Markets Solutions

WHY NOW

A growing IPO pipeline across the region is raising expectations from Board & Management.

WHAT WE DELIVER

- IPO Readiness Assessment
- IPO GRC Framework Implementation

BUSINESS IMPACT

Quick business alignment to listing requirements that meets tight deadlines.

Internal Audit & ICFR

WHY NOW

Board & Shareholders expect transparency that only progressive audit and ICFR solutions can deliver.

WHAT WE DELIVER

- AI-Enabled Internal Audit Services
- Digitized ICFR Services

BUSINESS IMPACT

Financial & process control gaps identified & mitigated in real-time, not year-end.

Note to developer: Each service card above maps to one grid item on the Service Portfolio page. Recommend an expandable/accordion or tab treatment ("AI & Digital Solutions" tab vs. "Intelligent Business Solutions" tab) so the page doesn't require scrolling through all twelve at once, consistent with the two-category structure already used in the source deck.

2.3 Let's Engage

2.3.1 List of Offerings: How We Engage

[READY]

Six signature engagement models, each scoped around a business outcome.

#	Engagement	Format	What You Get	Business Outcome
01	AI Value Discovery	Sprint (2–3 Weeks)	AI workshop, including an executive diagnostic & 2–3 prioritized use cases	A business case that leadership can act on, not just an informative slide deck.
02	AI Training	Sprint (1–2 Weeks)	Role-based AI training tailored to your sector and teams	Teams that can use AI, not just talk about it.
03	AI Transformation Roadmap	Strategic Engagement	Maturity diagnostic, resulting in use-case prioritization, AI roadmap & change plan	An AI roadmap tied to budget, timeline and named owners.
04	AI Proof of Value & Solution Build	Build Engagement	AI solution design, agile build & testing, and business integration	An AI solution live in your operating environment that scales with your business.
05	AI Governance & Risk Management	Advisory Engagement	AI risk assessment, governance framework and controls mapping to maintain accountability and ethical standards.	Governance that regulators and boards can rely on.
06	AI Adoption & Value Realization Office	Managed Service	AI adoption monitoring, KPI dashboards and continuous optimization	Value that is measured, sustained & scaled long after AI solution go-live.

2.3.2 Schedule a Meeting

[READY]

Every engagement starts with a conversation about the outcome you are aiming to achieve, not a generic sales call. So let's connect!

Suggested form fields

- Full name
- Work email
- Company name
- Job title / role
- Country / market (dropdown: UAE / KSA / Europe / Australia / Other)
- Area of interest (dropdown: 6 engagement models above, plus "Not sure yet")

- Preferred meeting format (Video call / In-person, where offices allow)
- Message (optional free text)

Note to developer: Route submissions to a live calendar-booking tool (e.g., Calendly-style embed) rather than a static "we'll be in touch" form, if possible. It reinforces the "execution, not just advice" brand promise from the first interaction.

3. Research & Learn

3.1 Thought Leadership

[NEEDS INPUT]

Note to developer: Until real releases exist, avoid populating this page with placeholder/dummy entries. An empty, well-designed "Thought Leadership" template with a short "More to come" note reads better than fake content.

Note this section is meant to be a content hub for articles, points of view, and short-form insights. This can be supported by a steadier cadence of shorter articles and LinkedIn-native posts repurposed onto the site. This keeps the hub active without requiring a whitepaper every week.

3.2 Algovia Academy

[NEEDS INPUT - DAC]

Note to developer: This section should highlight Algovia Academy as the public-facing brand for Algovia's training capability, directly extending the "AI Training" signature offer (see Section 2.3.1) into a standing, ongoing program rather than a one-off engagement deliverable.

Feedback to be obtained from DAC. This section can include

- *Executive & Board AI Literacy: short, high-level sessions for leadership audiences on what AI can and can't do, governance obligations, and change management.*
- *Practitioner Training: role-based training for teams who will actually use AI day to day.*
- *Technical Upskilling: deeper, hands-on tracks for internal technical teams working alongside Algovia on a build engagement.*

Also Algovia's own technical leadership includes active academic researchers (e.g., an Assistant Professor role at a leading technical university), which is a credible, differentiated proof point for Academy content. This should be reflected in Academy marketing rather than treated purely as a team bio detail.

4. Success Stories

[READY]

4.1 Government & Public Sector

[NEEDS INPUT - DAC]

Note to developer: Input pending for:

(a) case study from DAC, or (b) using the leadership credentials above as an interim "our public-sector pedigree" module in place of a case study, or (c) showing this sector with a short "in development" note rather than leaving it empty. Do not fabricate a case study.

4.2 Financial Services

Kinage: AI Personal-Finance MVP

Challenge: Bills, subscriptions, scam messages, and other financial events arrived in inconsistent formats that were hard to track. Kinage needed a functional MVP fast, to test with users, demonstrate value to investors, and support rapid iteration.

Solution: We built a secure inbox connector and parsing pipeline that extracts merchants, amounts, and due dates, then classifies bills, subscriptions, scams, and anomalies, converting the results into clear alerts inside a full-stack application.

Key Results:

- Accelerated market launch with a functional MVP for user testing
- Reduced future rework through a modular, extensible foundation
- Improved visibility and control over bills and financial risk

- Gave the team tangible evidence to support fundraising

Technology: Python · NLP · Classification Models · AWS

Note to developer: Refer to pictures from Algovia power point presentation.

4.3 Energy (Oil & Gas, Mining, Power & Utility)

H2TRAIN: Wearable Edge-to-Cloud Industrial Safety Platform

Challenge: Industrial sites needed earlier warning of unsafe physiological and environmental conditions. The wearable had to analyse time-critical signals on constrained hardware, while central teams still needed history, alerts, and reporting.

Solution: We integrated ECG, respiration, temperature, and movement sensors with on-device sensor fusion, ran inference with TensorFlow Lite, and built digital-twin models with cloud services for alerts, reporting, and risk prediction.

Key Results:

- Working multi-sensor wearable prototype
- Earlier warning may reduce incidents and downtime
- Continuous evidence supports reporting and prediction
- Digital twins plus cloud monitoring and alerts

Technology: TensorFlow Lite · Edge AI · Digital Twin · Cloud

Komatsu: Forest Mapping with Autonomous, Computer-Vision-Extended Drones

Challenge: Autonomous operation of forestry vehicles can only be planned at scale if the health, species, and condition of individual trees is known and precisely located, since precision is essential to managing forest health at scale.

Solution: We built a drone-based solution that flies the forest ahead of harvesting to determine 3D surface structure and localize trees with their characterization (diameter, species, bend), fusing RGB camera and LiDAR data with available national data to produce an enriched operational map. An on-machine sensing system combining LiDAR and standard color cameras also helps heavy forestry equipment understand its surroundings in real time, even in harsh operating conditions.

Key Results:

- Data collection platform for surface reconstruction and object recognition
- Semantic segmentation of the forest
- Data fusion from LiDAR and cameras

Technology: Python · Open3D · OpenCV · PyTorch · MM Segmentation

SatVitAi: Satellite Edge AI for Precision Viticulture

Challenge: Vineyard managers across the Iberian Peninsula needed real-time, data-driven monitoring of vine maturity, disease, and yield anomalies without relying on continuous cloud connectivity.

Solution: Our embedded systems and AI team designed and implemented an on-device inference pipeline, from model optimization for CubeSat-class hardware to multispectral data preprocessing and object-detection workflows capable of identifying areas of decreased yield against baseline parameters like soil moisture. The solution runs within a Kubernetes-orchestrated environment tailored to satellite-grade compute constraints, as part of the EU Horizon Europe AGRARIAN programme (Pilot 3: Spain/Portugal Viticulture, 470 hectares across 10 grapevine growers).

Key Results:

- Selected as an Open Call winner under EU Horizon Europe's AGRARIAN programme
- Near-real-time vine maturity estimation, disease detection, and yield-anomaly identification
- Runs on constrained, satellite-grade edge hardware without continuous cloud connectivity

Technology: Python · Edge AI · Multispectral Imaging · NDVI · Kubernetes · CubeSat Emulation

4.4 Technology, Media & Telecommunications

TalkTwelve: Production Legal AI Platform

Challenge: TalkTwelve, an employment-law service, received open-ended client enquiries that often lacked key facts. Solicitors spent over 60 minutes per case gathering information and preparing a summary before a consultation could even begin.

Solution: We built a conversational AI agent that asks targeted follow-up questions, retrieves approved legal content through RAG, and converts each enquiry into a structured, solicitor-ready brief, deployed securely on AWS with built-in payments and video consultations.

Key Results:

- Cut intake time from over 60 minutes to about 12 minutes
- Produced more complete, consistent consultation briefs
- Freed solicitor capacity for higher-value case work
- Lowered cost per case without adding headcount

Technology: Python · React · Qdrant · Keycloak · AWS

Invisible Technologies: Data Platform Rebuilt for Reliability & Cost Control

Challenge: Invisible runs a Databricks medallion architecture processing data across raw, cleaning, and business-ready layers. As the platform scaled, operational control did not scale with it: pipeline failures went undetected, cloud costs accumulated without attribution, and code changes were validated only by observing production behaviour.

Solution: We built a data-quality monitoring system across all three medallion layers with automated alerting, introduced a local testing layer before production deployment, implemented hash-based deduplication for datasets without primary keys, and delivered granular, job- and cluster-level cost dashboards.

Key Results:

- Pipeline anomalies detected automatically across Bronze, Silver, and Gold layers
- Production incidents from untested code eliminated
- Reliable deduplication across datasets with no primary keys
- Full cost attribution at job and cluster level

Technology: Python · PySpark · Databricks · Temporal · Notebooks · Delta Lake

Major European Telecom Operator: Automated Fibre Optic Installation Validation

Challenge: Manual inspection of fibre optic cable installations was slow, labour-intensive, and prone to inconsistency, creating significant delays and errors in compliance and deployment timelines.

Solution: We developed an automated inspection system powered by computer vision and machine learning that validates fibre optic installations in real time, reducing manual effort, enhancing accuracy, and accelerating deployment.

Key Results:

- Real-time fibre optic inspection with an AI-driven photo validation system
- Reduced deployment errors and costs

- Scalable and customizable across environments
- Enhanced operator efficiency

Technology: Python · PyTorch · Hydra · GradCam · FastAPI · OpenCV · NumPy

Intel Poland / Revoize: Revolutionizing In-Car Speech Enhancement

Challenge: Poor audio quality remains a cross-industry issue. Most tools simply remove noise from a recording using discriminative methods; results can be satisfactory but not category-defining.

Solution: Revoize, Algovia's GenAI Audio R&D initiative, set new standards in real-time audio processing through state-of-the-art analysis, microphone-array geometry design, and iterative development of high-performance DSP algorithms, exceeding results achieved by market incumbents, including flagship Adobe products.

Key Results:

- Real-time speech enhancement exceeding established market incumbents
- New microphone-array geometry design
- Iterative, PhD-led R&D methodology with rigorous algorithm evaluation and optimization

Technology: Audio DSP Algorithms · Microphone Array Geometry Design · Speech Enhancement Techniques · Iterative R&D Methodology

4.5 Real Estate

Eazli: Scalable Multi-Agent Marketplace for KSA Property, Lifestyle & Services

Challenge: Eazli's early prototype could handle only simple, single-service requests. It could not break complex needs into tasks, activate the right specialists, or give management visibility into service quality and AI costs as the platform grew.

Solution: We designed a central AI concierge that interprets each customer's needs, plans and delegates tasks to specialist agents through standardised interfaces, and shares context through RAG, with built-in monitoring of performance, quality, and per-query cost.

Key Results:

- Enabled new services to launch without rebuilding the core platform
- Cut the time and cost of integrating new specialist capabilities
- Opened new cross-selling opportunities across verticals
- Gave management real-time control over quality and AI spend

Technology: Python · LLM Orchestration · RAG · AWS

Oculo: Turning On-Site Data into Actionable Construction Insights

Challenge: Construction project managers, engineers, and other professionals needed a single, reliable source of truth for on-site progress, allowing them to inspect, spot issues, and make decisions faster, even miles away from site.

Solution: Our deep-tech team co-developed the computer vision algorithms for progress monitoring, using 360° cameras to create an up-to-date "street view" of a construction project, and was responsible for the design and development of the frontend, backend, and mobile applications, delivered in a dedicated-team model with elements of fixed scope, budget, and time for the computer vision component.

Key Results:

- A single, up-to-date "street view" source of truth for on-site progress
- Faster inspections and issue detection, remotely
- Full-stack delivery: computer vision, frontend, backend, and mobile

Technology: OpenCV · Python · NumPy · Docker · PyTest · AWS · React · Kotlin · Swift

4.6 Healthcare

Everon: Remote Patient-Care Device Re-Architecture

Challenge: The nursing device needed reliable links to patient-side equipment, clearer remote consultations, and better power management, while preserving clinical function and avoiding unnecessary recertification.

Solution: We redesigned the firmware around BLE, Bluetooth Classic, and GSM/MBIM links, added digital signal processing for noise and echo cancellation, and revised power management to extend battery life and support multi-patient monitoring.

Key Results:

- Extended battery life to approximately two days
- Improved remote consultation voice quality
- Added multi-patient monitoring capability
- Lowered support burden and recertification risk

Technology: C/C++ · RTOS · BLE · GSM/MBIM · DSP

DiaperID: Parent-Facing App Screening for Liver-Disease Indicators

Challenge: Biliary atresia and related conditions can first appear as changes in stool colour. The product needed to convert parent-captured photos into a reliable screening signal, without requiring any medical knowledge from users.

Solution: We built a React Native app that guides parents through image capture and quality checks, then a Python-based computer-vision model, trained on clinically annotated images, analyses each submission against an MDR-aware validation workflow.

Key Results:

- Supports earlier referral for high-risk infants
- Delivers scalable screening with less regulatory rework
- Removes reliance on parents' clinical judgement
- Provides a validated, production-ready capture pipeline

Technology: React Native · Python · TensorFlow · Computer Vision

motus med: Accelerating Infant Seizure Diagnosis with Computer Vision

Challenge: Diagnosing infantile spasms in toddlers is difficult due to the subtle and sporadic nature of seizures, often leading to delays in treatment and severe long-term consequences. Traditional methods are slow and reliant on rare in-clinic observations.

Solution: We helped the motus med team of neurologists develop an AI-driven tool that uses smartphone videos taken by parents to enable rapid, accurate detection of epilepsy, empowering parents and healthcare providers to diagnose seizures early and reduce the risk of long-term cognitive impairment.

Key Results:

- AI-enhanced, smartphone-based seizure detection
- Accelerated diagnosis and treatment
- MDR Certification (Class IIb) support
- Patient-centric UX validated with clinicians

Technology: Python · Open3D · OpenCV · PyTorch · MM Segmentation

METIS: Point-of-Care Antibiotic Decision Support

Challenge: Traditional lab pathways can delay antibiotic treatment decisions by days. The workflow needed to combine patient, diagnostic, and guideline inputs into one practical interface, without specialist lab hardware, and fit for GP and paediatric visits.

Solution: We combined clinical recommendation logic with computer-vision analysis of diagnostic inputs, presented through a mobile-compatible, clinician-facing interface, backed by a product architecture and validation roadmap for sub-five-minute response.

Key Results:

- Makes guidance available during the same patient visit
- Supports better prescribing and shorter diagnostic cycles
- Combines clinical logic with computer-vision analysis
- Provides a validated architecture ready to scale

Technology: Python · Computer Vision · Machine Learning · Mobile

CaReHigh: Mobile Patient Platform and Registry for FH Care & Research

Challenge: Familial hypercholesterolaemia patients needed accessible information, adherence support, and easier study participation, while clinical teams needed structured registration and follow-up without adding manual coordination work.

Solution: We built a React Native app and Python backend supporting onboarding, adherence tracking, and research participation, backed by a structured registry model, shaped by patient and practitioner research and an MDR risk assessment.

Key Results:

- Strengthened patient engagement and research participation
- Reduced coordination effort for clinical teams
- Created reusable, structured patient data
- Clarified which functions fall under medical-device regulation

Technology: React Native · Python · MDR Compliance

Mayo Clinic: Benchmarked Medical-Imaging Pipeline for Stroke Etiology Classification

Challenge: Identifying the underlying cause or subtype of a stroke from microscopic tissue images is a complex research challenge, requiring rigorous image curation, standardized preprocessing and segmentation, specialized deep-learning development, and independent testing beyond a single benchmark submission.

Solution: The team developed an end-to-end AI system combining a curated image repository with HistomicsTK-based preprocessing and segmentation, followed by training and validation of a specialized deep-learning model using PyTorch and MONAI, independently benchmarked through Kaggle.

Key Results:

- Achieved a Silver Medal benchmark: 46th of 896 teams
- Delivered independently validated technical performance
- Created reusable assets to accelerate clinical research
- Enabled continued experimentation beyond the benchmark

Technology: Python · PyTorch · MONAI · HistomicsTK

4.7 Education

[NEEDS INPUT - DAC]

Note to developer: DAC Input required. Do not fabricate a case study for this sector.

4.8 Transport & Aviation

MuuMap (D-Box): Digitizing Milk Collection Logistics Across Europe

Challenge: The dairy industry has long relied on manual route planning and limited real-time monitoring, with poor communication between dairy plants, farmers, and drivers hindering optimization of the milk supply chain.

Solution: We developed MuuMap, a digital system that streamlines milk collection logistics through real-time tracking, optimized route planning, and seamless communication between dispatchers and drivers, reducing collection times and fleet requirements.

Key Results:

- Real-time tracking for better process control
- Optimized routes cutting transport costs
- Seamless communication between dispatchers and drivers
- Improved efficiency, cost, and food safety outcomes

Technology: Java + Spring · Kotlin · React · OpenStreetMap · MySQL + MongoDB · Python · Yocto Linux · LTE

Note to developer: This is a fleet-logistics and supply-chain case study rather than passenger transport or aviation. It is the closest fit available in the source deck to this sector. Recommend Algovia consider whether a passenger-transport or aviation-specific case study should be commissioned to better match the sector name.

4.9 Retail & Manufacturing

STIHL: Enterprise-Wide Agentic AI Governance Strategy

Challenge: STIHL experimented with LLMs and low-code tools without a centralized adoption plan. After dozens of fragmented initiatives across regions and departments, the enterprise wanted to organize its data, select the right AI use cases, and protect the organization against data leaks and security breaches.

Solution: Our experts designed workshops and education plans to consolidate initiatives, prioritize AI use cases, and balance internal development with external help, laying the foundation for an enterprise-wide AI strategy across STIHL's SAP, Databricks, and Microsoft Azure environments.

Key Results:

- Education on enterprise-level AI system design
- Agentic AI use-case assessment and prioritization
- Data governance strategy for AI initiatives

Technology: Enterprise AI Strategy · Data Governance · Agentic AI Readiness

Furniture Manufacturer: Multimodal Engineering Copilot for Drawings, Product Matching & BOMs *(Illustrative example)*

Challenge: Senior engineers manually reviewed CAD drawings and specifications, translated requirements into configurations, and built bills of materials and pricing by hand: a slow process exposed to configuration errors and margin leakage.

Solution: We built a copilot that extracts dimensions and requirements from CAD drawings, matches them to the product library, applies configuration rules, and generates BOMs and proposal content, routing uncertain cases to engineers for review.

Key Results:

- Accelerated quotation turnaround significantly
- Increased bid capacity without adding engineering headcount
- Reduced configuration, pricing, and version-control errors
- Strengthened margin protection through consistent BOMs

Technology: Python · Computer Vision · TopSolid Integration · AWS

AIMS5.0: Edge AI and OT/IT Architecture for Real-Time Manufacturing

Challenge: Cloud-only processing does not suit production lines that are air-gapped, security-sensitive, or dependent on immediate machine-level decisions. The EU Horizon program also needed reusable technical patterns and coordinated work packages.

Solution: We placed inference close to the machines, integrated sensor and equipment data through industrial protocols, and defined OT/IT bridge and sensor-fusion patterns, leading work packages across the EU Horizon-funded consortium.

Key Results:

- Enabled faster decisions with less cloud dependency
- Strengthened data control and reusable industrial IP
- Delivered consortium work packages and publications
- Established reusable architecture patterns for future lines

Technology: Python · C++ · Edge AI · OT/IT Integration

Prohan: Computer Vision Defect Detection in Wood Furniture Manufacturing

Challenge: Prohan, a hardwood furniture maker, faced costly defects: cracks and gaps only tenths of a millimetre wide, invisible to the human eye. With 5% of glued panels discarded, defects caused a €40K monthly loss (2% of €2M sales).

Solution: Our computer vision system detects defects immediately after gluing, monitoring the production line 24/7 in low light and dust conditions, triggering warnings to prevent faulty panels from reaching final production.

Key Results:

- 90% defect detection during production
- 0% defects in final products
- 0% returns from undetected flaws

Technology: Python · OpenCV · PyTorch · Docker · Pandas

Gold Guard: Handheld Edge-AI Jewellery Authentication

Challenge: Reflective gold, gemstones, and variable lighting make automated authentication difficult. Before investing in expensive hardware, Gold Guard needed evidence that a handheld authentication device was technically achievable, plus a credible investor roadmap.

Solution: We combined macro imaging with cross-polarised and coaxial lighting, IMU-gated capture for stable images, and a quantised edge-AI verification model, defining laboratory testing, hardware direction, and a delivery roadmap.

Key Results:

- Specialised lighting and close-up photography reduced reflections and revealed key details

- Motion sensors ensured the device captures images only when stable
- A lightweight on-device AI model returns a result in under five seconds
- Defined lab tests, hardware requirements, development stages, and investment roadmap

Technology: Edge AI · Computer Vision · Quantised Inference

PNK Group: AI-Powered Defect Detection for Precast Concrete

Challenge: PNK Group aimed to reduce defects in precast concrete manufacturing by improving detection of geometric inaccuracies, misalignments, and surface defects such as bulges, cavities, and pores, traditionally reliant on error-prone manual inspection.

Solution: We developed an AI-powered vision system using handheld 3D scanners and a mobile multi-camera rig: 3D scanners and RGB cameras captured detailed visual and point-cloud data, machine learning identified geometric deviations and surface flaws with real-time alerts, and a modular design allows easy adaptation to new product lines.

Key Results:

- Automated defect detection replacing manual inspection
- Real-time alerts on geometric and surface defects
- Modular system expected to cut future adaptation costs by 20–30%

Technology: OpenCV · Python · PyTorch · Open3D · Zivid SDK

ALTANA: Advanced Quality Inspection for Paint Monitoring

Challenge: Altana, a global leader in specialty chemicals, needed an automated solution to ensure color consistency and detect imperfections like air bubbles, reducing defects and improving customer satisfaction.

Solution: We developed a computer vision system using colorimetric cameras for precise defect detection: analyzing and classifying defects by severity, ensuring accurate color-consistency checks, automating real-time defect detection on the production line, and flagging potential defects early through predictive analytics.

Key Results:

- Automated, real-time paint quality inspection
- Consistent, high-precision color checks
- Early, predictive flagging of potential defects

Technology: OpenCV · Python · NumPy · Docker · PyTest

Edible Oil Producer: Automated Defective Cap Detection for High-Speed Bottling

Challenge: An edible oil producer operates a high-speed line at 270 bottles per minute, aiming for 410–420. Manual quality control was labour-intensive and costly, and the business needed to detect defective caps in real time, remove faulty bottles automatically, and integrate with its rejection system for fast deployment.

Solution: We developed a real-time vision system to identify cracked, loose, or missing caps, ensuring immediate defect removal integrated directly with the existing rejection system.

Key Results:

- Real-time detection and removal of defective bottles
- Reduced reliance on manual quality control
- Fast integration with existing rejection systems

Technology: OpenCV · Python · NumPy · Docker · PyTest

10Beauty: Autonomous Manicure Innovation with Precise Computer Vision

Challenge: 10Beauty set out to automate a traditionally manual process, applying nail polish and preparing nails by removing old polish and shaping cuticles, requiring a robust computer vision system for precise 3D hand positioning and nail segmentation across diverse skin tones, nail shapes, and polish colors.

Solution: We delivered a highly accurate 3D positioning system and nail-segmentation pipeline, improving efficiency by over 10x and paving the way for the first production prototypes.

Key Results:

- Accurate 3D hand and nail positioning using stereo vision
- Precise nail segmentation (accuracy greater than 0.25mm)
- Pipeline handles diverse skin and nail combinations
- Scalable solution with continuous performance improvement

Technology: Open3D · OpenCV · Python · Jupyter Notebook · Matplotlib · PyTest · AWS

5. Our Team

5.1 Our Team

[READY]

Founder bios are covered in full under Section 1.1.3 (Our Founders) and should be reused here rather than duplicated. Recommend this page link back to, or directly embed, that content. In addition to the four co-founders, the extended leadership and delivery team includes:

Krzysztof Radecki

Chief Technology Officer

[Bio not yet available; placeholder in source deck. Needs input from Algovia before publishing.]

Marek Tatara, PhD

Chief Scientific Officer / Head of AI

Marek is a researcher working on machine learning, signal processing, and embedded computing since 2006. He has led over 40 successful AI projects, advised on 200+ AI implementations, and served as a Tech Lead in numerous R&D initiatives. He combines academic expertise as an Assistant Professor at Gdańsk University of Technology with extensive commercial experience in Computer Vision.

Łukasz Fedorowicz

Head of AI Design

Łukasz has over 20 years of experience in Design, specializing in UX, User Research, and Interaction Design. He has conducted numerous in-depth interviews, usability audits, and design sprints, driving user-centered innovations for top-tier clients, and has mentored design teams and led cross-functional projects to enhance digital experiences across commercial, technology, education, and finance sectors.

Note to developer: Krzysztof Radecki's bio was left as a placeholder ("xx") in the source deck. Request the finished bio from Algovia before this page goes live.

5.2 Our Subject Matter Resources

[READY]

700+

professionals specialized in the fields of Artificial Intelligence, Software Engineering, Data Analytics, Business Intelligence, and Digital Transformation.

Subject matter resources span industry sectors: Government & Public Sector, Financial Services, Energy, Technology, Media, Telecommunication, Real Estate, Healthcare, Education, Transport, Retail & Manufacturing and various business advisory domains.

Note to developer: The "700+" figure works well as a large animated counter or stat callout, consistent with how it's used as a visual anchor in the source deck. The sector list above is the same list used to structure Section 4 (Success Stories); consider a shared, reusable "sector tag" component across both pages.

6. Talk to Algovia AI

Interaction flow

1. Identify the problem statement

Open with a small number of guided discovery questions rather than a blank chat box. This keeps the interaction focused and avoids generic small talk. Suggested opening prompts:

- "What's the AI challenge you're trying to solve?" (free text)
- Optional quick-select chips for common entry points: "We don't know where to start" / "We have pilots that never scaled" / "We need governance for AI we're already using" / "We want to explore a specific service"

2. Provide an AI Agent response leveraging available content

The agent should answer using Algovia's own site content as its grounded source of truth: the Value Proposition, the AI Value Gap framework (Section 2.1), the Service Portfolio (Section 2.2), and relevant Success Stories (Section 4), rather than general AI knowledge. This is both more accurate and more on-brand: Algovia's positioning is about grounded, accountable execution, and the chatbot should reflect that.

Note to developer: This section refers to a conversational AI experience embedded on the site, both a genuinely useful visitor tool and a live demonstration of Algovia's own AI capability.

Recommend a retrieval-augmented setup indexed on this document's Sections 2 and 4 (or their live website equivalents) so answers stay consistent with published positioning and are easy to keep in sync as the site content evolves.

3. Provide a standardized response on next steps & link to "Let's Engage"

Once the agent has identified a relevant service or engagement model, it should close with a consistent call to action, for example:

"Based on what you've described, our [Engagement Name] model is likely the right starting point. Would you like to schedule a conversation with our team?"

This should deep-link directly into the Schedule a Meeting flow (Section 2.3.2), ideally pre-filling the "Area of interest" field with the relevant engagement model so the visitor doesn't have to repeat themselves.

4. Obtain contact details

Only after the agent has delivered genuine value (i.e., after step 2–3, not before) should it request contact details, framed as enabling follow-up rather than gating the conversation:

- Name
- Work email
- Company name
- (Optional) phone number

Note to developer: Do not gate the initial conversation behind a contact form. The value of this feature is that it feels like a genuine capability demonstration. Ask for contact details only once the visitor is ready to move to next steps, consistent with the flow above.

Appendix A: Brand at a Glance

Reference palette and typography pulled directly from the approved Algovia AI presentation, for design consistency between the deck and the website.

Color palette

	Hex	Name / Usage
	#0B2426	Near-black teal: primary text, dark section backgrounds
	#024549	Deep teal: secondary dark backgrounds, card headers
	#02BB73	Signature green: primary accent, CTAs, highlights
	#029961	Muted green: eyebrow labels, secondary accents
	#5A716F	Muted gray-teal: body copy on light backgrounds
	#ECF1F5	Light blue-gray tint: soft card / section backgrounds

Typography

Poppins, used across headings and body copy in the source presentation (multiple weights: Light, Regular, Bold). Recommend matching this on the website for visual continuity with the sales deck and other collateral.

Logo

- Wordmark: "ALGOVIA AI" with a distinctive double-slash mark in the signature green.
- Two versions in use: a dark version for light backgrounds, and a reversed/white version for dark backgrounds.
- Request vector (SVG) versions of both from Algovia for web use, rather than exporting from the deck's raster images.

Tone of voice

Confident, precise, and execution-focused. Leans into direct contrast statements rather than generic consulting language; the clearest example being the company's own self-definition:

"We are not a traditional consultancy. We are not a software vendor. We are the partner that connects both, and stays accountable until AI becomes business as usual."

Recommend carrying this same directness into web copy generally: short, declarative sentences; naming the failure mode before naming the solution; and avoiding generic phrases like "trusted partner" or "end-to-end solutions" that Algovia's own positioning explicitly pushes against.
